JAMBE general purpose model as controller models distribution platform

NISSAN Motor Co., Ltd.
Powertrain and EV Control Technology Department
Atsushi SAITO

Executive summary

I share the challenge of "JAMBE general purpose model (JAMBE generic model / Easy MIL) has been used as controller model distribution platform in NISSAN".

- **Our problem**
  We sometimes lose the opportunity MBSE iteration.
  It took huge time to connect between PLANT model and CONTROLLER model, because CONTROLLER model was distributed standalone.

- **Our solution trial**
  1. CONTROLLER model is implemented to JAMBE generic model.
  2. It has been distributed as a easy model in the loop(MIL).
  3. Validator transfers necessary bare minimum CONTROLLER model from JAMBE generic model to validator's target MIL.

NISSAN Motor Co., Ltd.
Powertrain and EV Control Technology Department

■**Experience:**
10 years in Powertrain (Diesel) software engineer at German supplier.
20 years in Powertrain (Diesel/Gasoline/xEV) control system engineer at NISSAN.

■**My home country:**
I have lived in Japan 98% of my life.
I had lived in Germany Stuttgart for 1year.

Problem recognition

■CONTROLLER model distribution for validation had been stand-alone.

As-Is:

> Can you share Controller model for MIL creation?

> Sure, immediately.

Virtual validation

Controller design

> Mmm, I send Whole model at the moment, because not sure about target system well.

Q&A

> There are too many interfaces to connect, and Speed is very slow.

[What's the problem?]
Controller model standalone distribution
➔It takes huge time for MIL...

1.Creation
   Q&A for the model connection.

2. Execution
   Execution time of MIL simulation unnecessary control models implement.
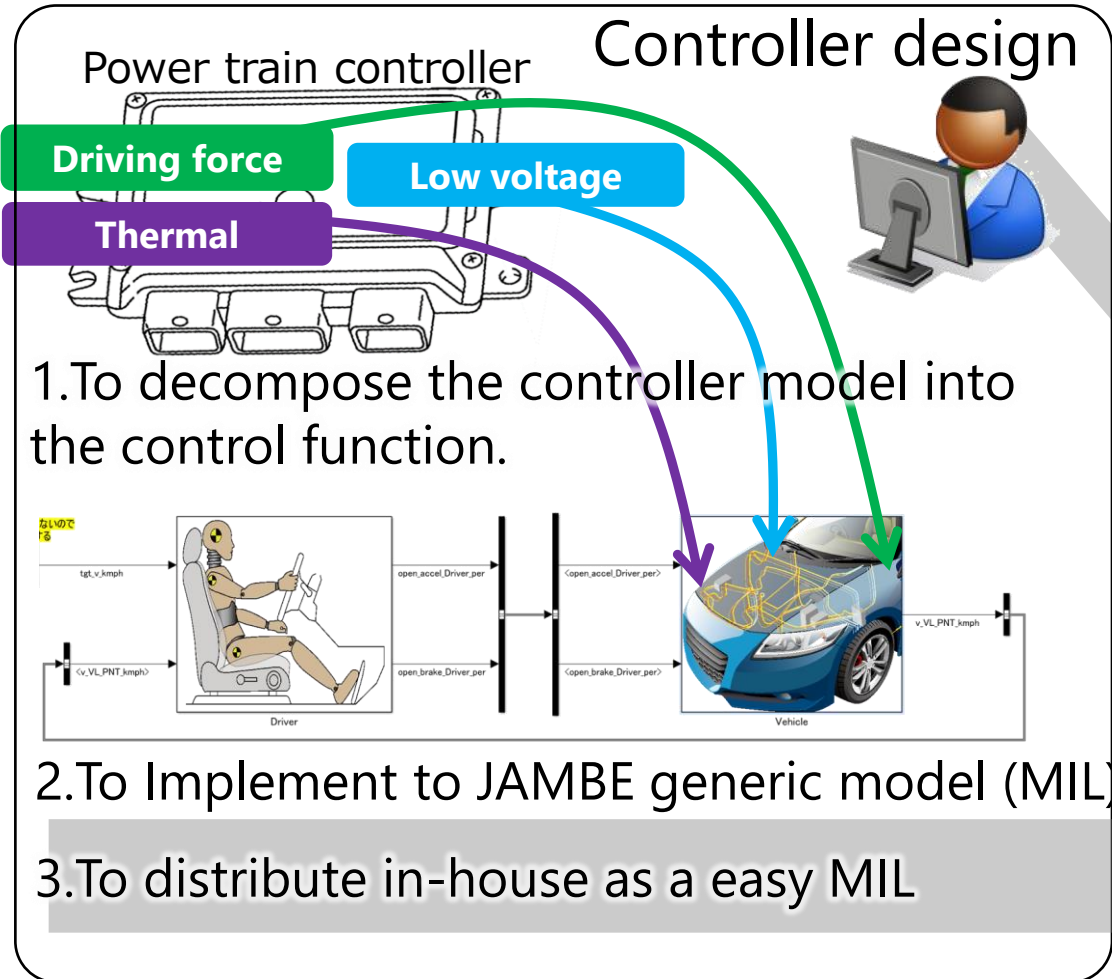

■Lose the opportunity...

To the next process

NISSAN
MOTOR CORPORATION

Problem recognition

■CONTROLLER model distribution for validation had been stand-alone.

[Solution idea] JAMBE generic model uses as controller models distribution platform.
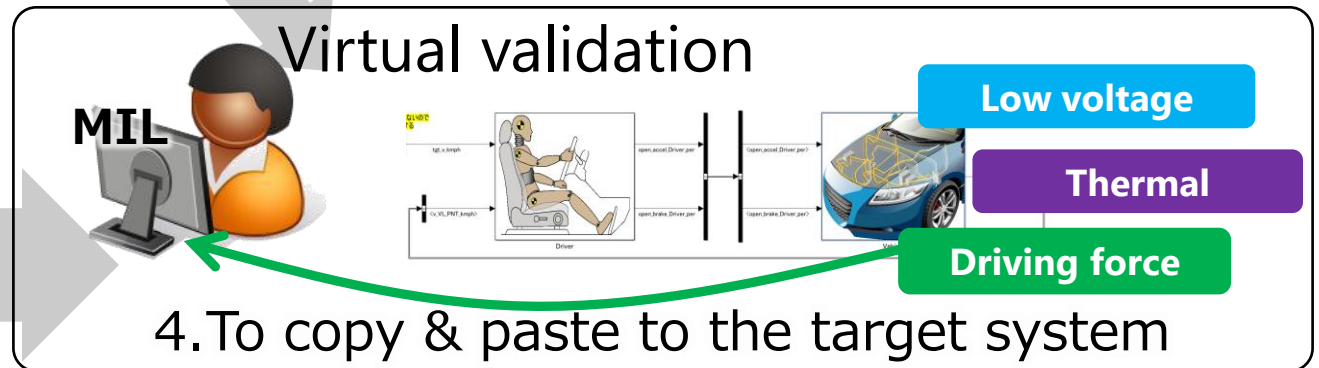

Controller design

Power train controller

Driving force

Low voltage

Thermal

1.To decompose the controller model into the control function.

2.To Implement to JAMBE generic model (MIL)

3.To distribute in-house as a easy MIL

[Prospect]
Controller model as a MIL distribution
➡It spends <u>less time</u> for MIL...
1.Creation
To reduce Q&A.
2. Execution
To be able to choose necessary control

Virtual validation

MIL

Low voltage

Thermal

Driving force

4.To copy & paste to the target system

■Implemented model distribution challenge using JAMBE generic model

[Why does NISSAN use JAMBE generic model for controller model distribution?]
➔It has stable foundations as good point.

Good point 1.
Energy domains are modeled based on physical networks.

Good point 2.
The modeling balance between resolution and runtime is well suited for distribution.

NISSAN
MOTOR CORPORATION

■Why does NISSAN use JAMBE generic model for controller model distribution?

<u>Good point 1.</u> Energy domains are modeled based on physical networks.
The controller is equipment of power estimation/adjustment from across variable (eg. Volt / Speed).
➔Correct relationship between energy domains is important for correct simulation behavior.

NISSAN
MOTOR CORPORATION

Our trial

■Why does NISSAN use JAMBE generic model for controller model distribution?

<u>Good point 2.</u> The modeling balance between resolution and runtime is well suited for distribution.

Modeling balance

Controls

Mechanical energy

Electrical energy

Thermal energy
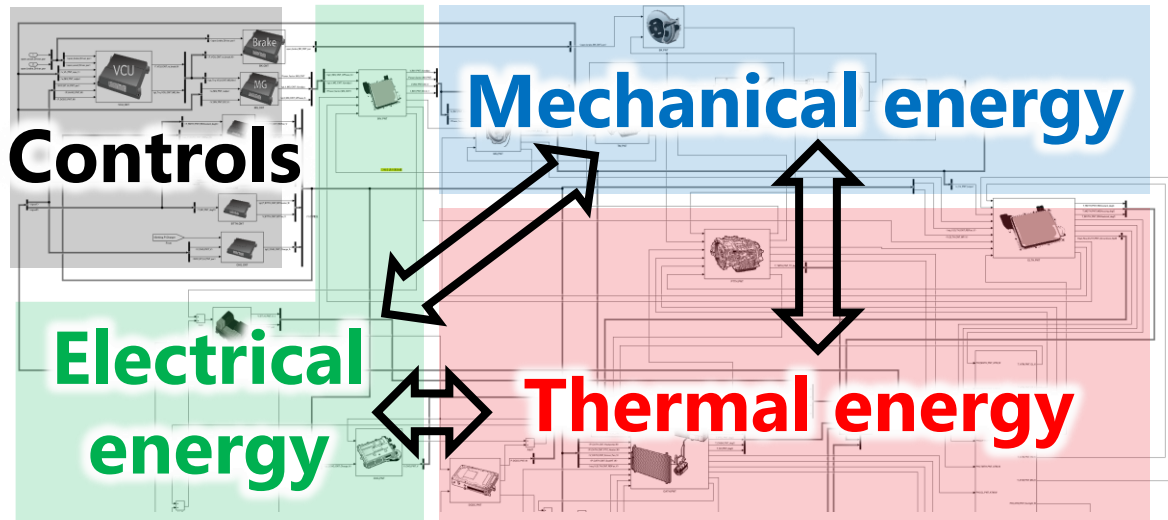

■The enough energy domains are contains in the powertrain control area.
■The physical network between each energy domain is reproduced.

Runtime @WLTC mode (class3b) 1800[s]

Model	Time(s)
<u>Our trial</u> Controller : NISSAN Driving force model Plant : JAMBE Generic model	700
<u>Reference</u> Controller : JAMBE Generic model Plant : JAMBE Generic model	50

■ It is acceptable speed for control behavior confirmation.
(faster than 2.5 times than real plant)
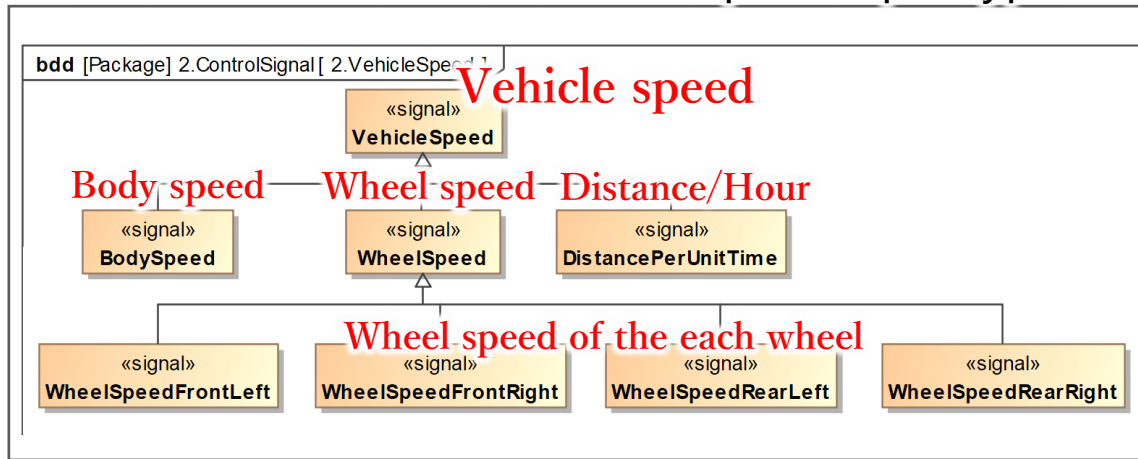

NISSAN MOTOR CORPORATION

Our trial

■Implemented model distribution challenge using JAMBE generic model
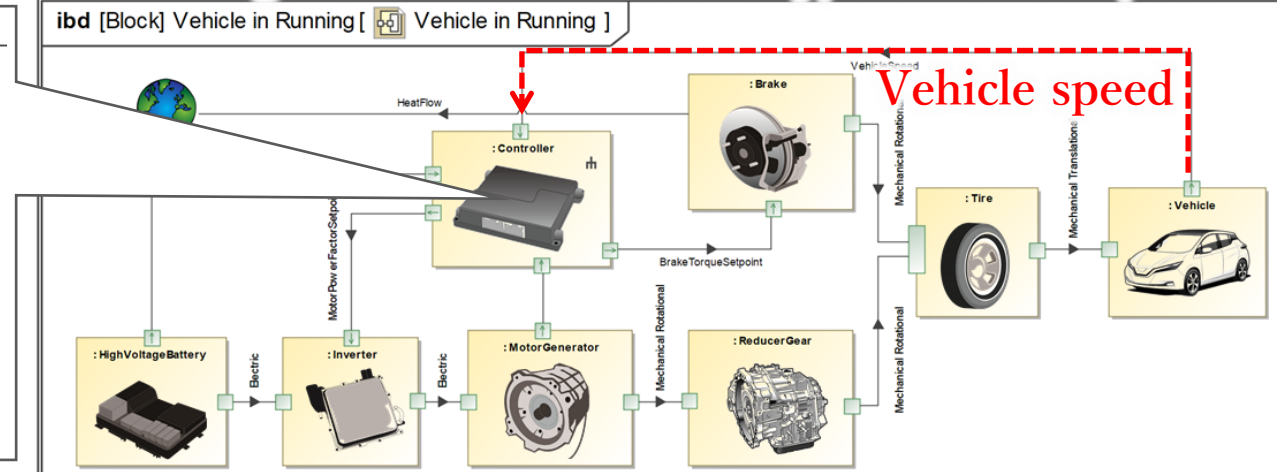

[Tough job point]
We had to create a wrapper models that fulfilled all controller inputs.

To give an example: There are many vehicle speed inputs for powertrain controller.

REAL : Several kind of vehicle speed input type

JAMBE generic model : Just one type of vehicle speed

The controller behavior cannot be reproduced without correct inputs.
➔It needs to create a wrapper model for all controller inputs.
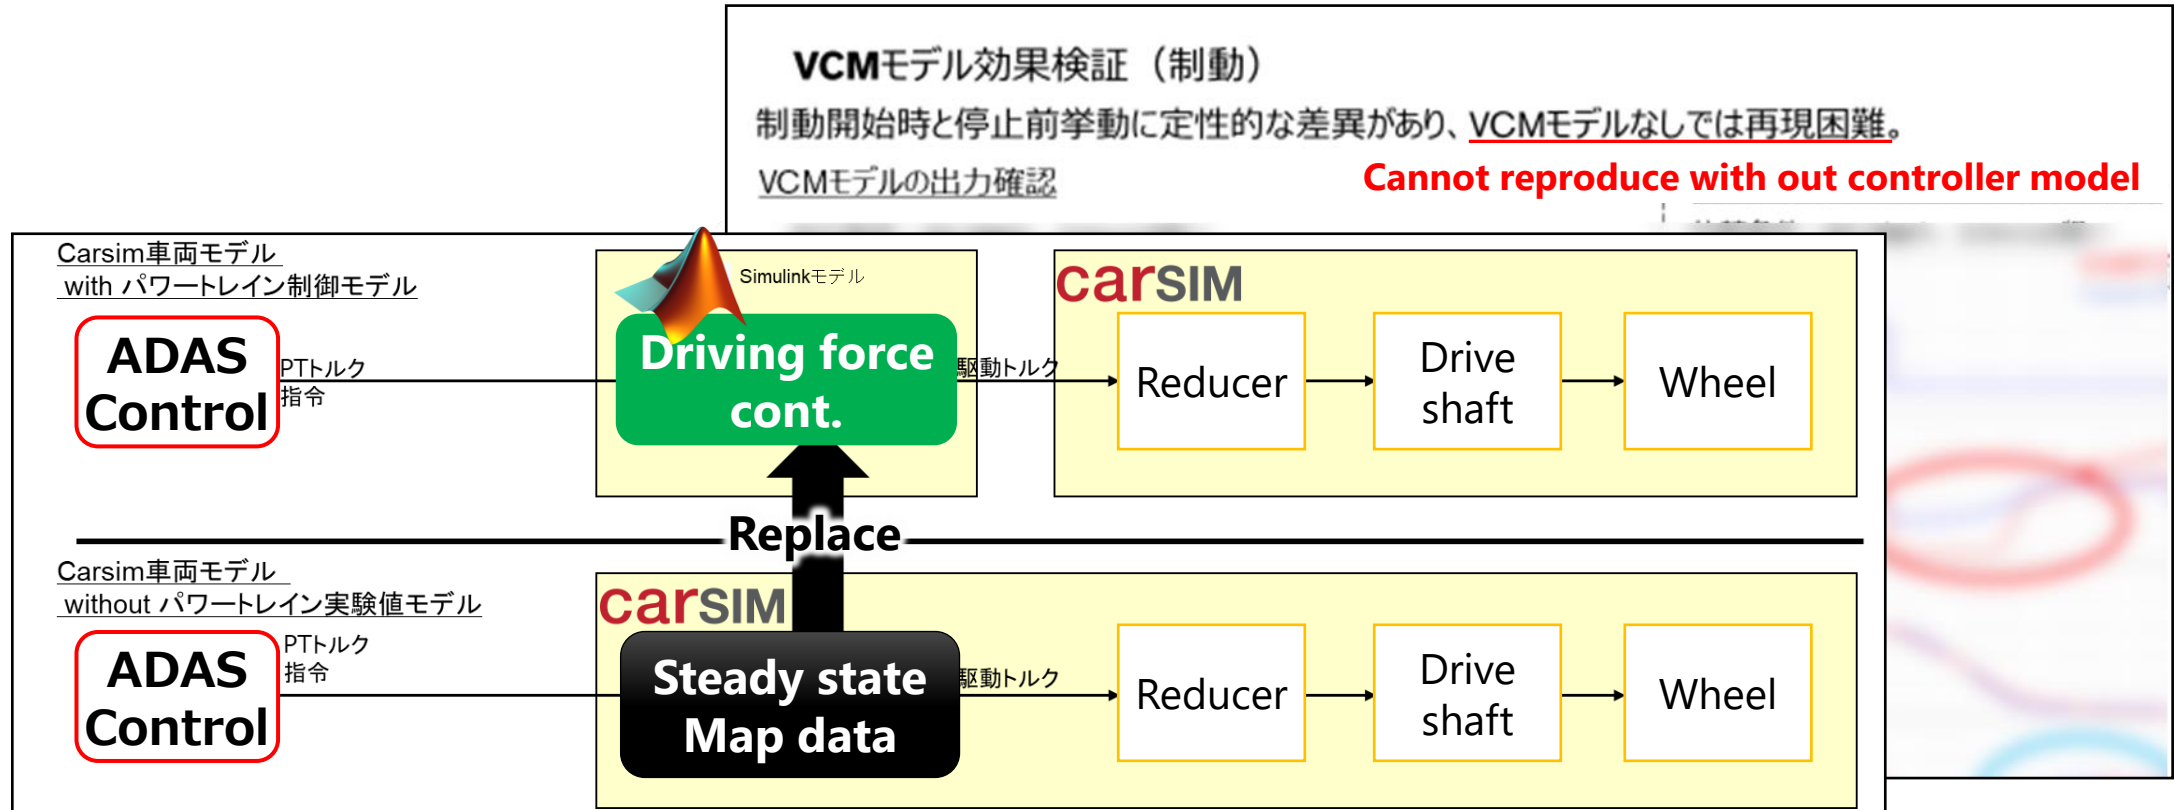

NISSAN
MOTOR CORPORATION

■Case study for ADAS virtual validation

xEV autonomous driving Co-simulation had took place between ADAS control model and Powertrain control model. It could reproduce transient scene of regeneration.

➔Trade-offs between drivability and efficiency can be validated on the V-bank left.

VCMモデル効果検証（制動）

制動開始時と停止前挙動に定性的な差異があり、VCMモデルなしでは再現困難。

VCMモデルの出力確認

Cannot reproduce with out controller model

■Wrap-up
- ✓ There are prospects for improving in-house control models distribution.
- ✓ MBD can be proceeded by improving control model distribution.

■Future outlook
- ✓ Expand the distribution area of control models as analysis model(MBD).
- ✓ Expand understanding using descriptive models(MBSE).
